

Netflix Movies & TV Shows Analysis

Introduction

Netflix is one of the world's leading streaming platforms, offering a wide variety of movies, TV shows, documentaries, and original content. Over the years, Netflix has significantly expanded its content library to serve audiences across different countries and cultures.

The objective of this project is to analyze Netflix's content dataset and identify trends related to content type, production countries, ratings, and content growth over time. Using Python and data visualization libraries, the dataset was explored to gain meaningful insights into Netflix's content distribution and evolution.

Dataset Overview

The dataset contains information about movies and TV shows available on Netflix. It includes details such as title, content type, country of production, date added, release year, rating, duration, and genre.

The dataset was analyzed using Python libraries including Pandas, Matplotlib, and Seaborn. Various visualizations were created to understand content distribution, production trends, and Netflix's growth over the years.

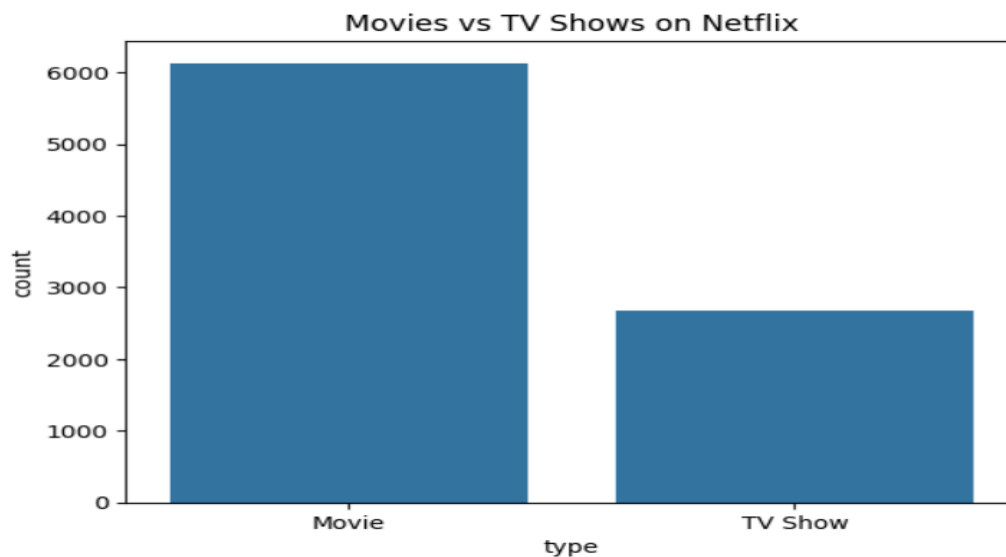

Research Question

How has Netflix's content library evolved over time, and what trends can be observed in the distribution of Movies and TV Shows?

Visualizations

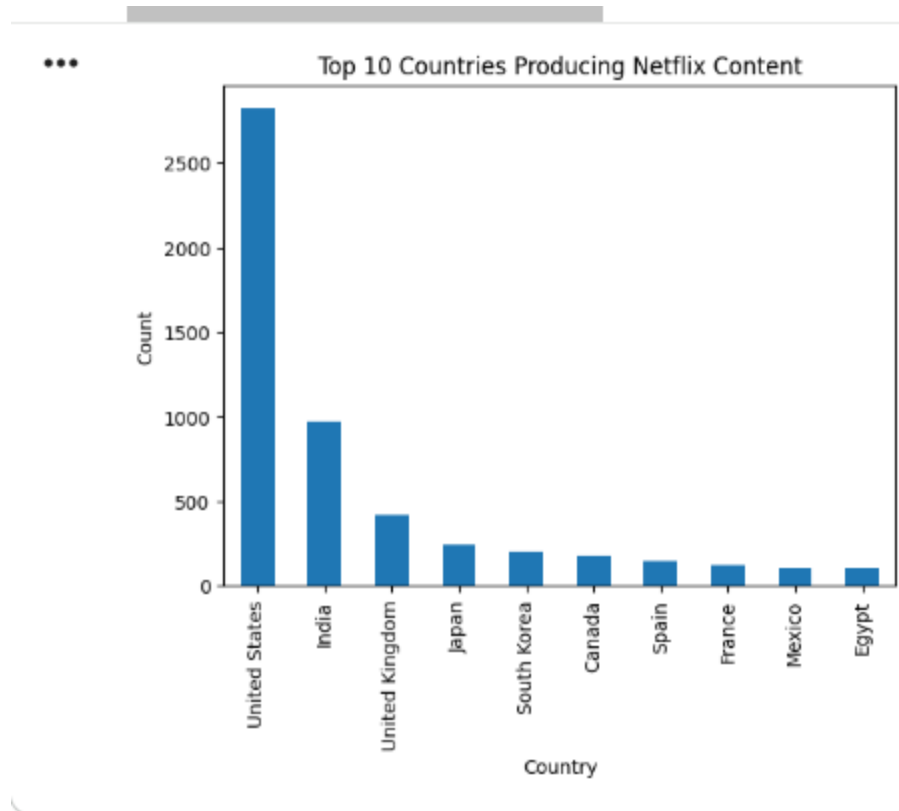

1. Movies vs TV Shows on Netflix

This visualization compares the number of Movies and TV Shows available on Netflix. The graph helps understand the distribution of content types on the platform and shows which category is more dominant.

2. Top 10 Countries Producing Netflix Content

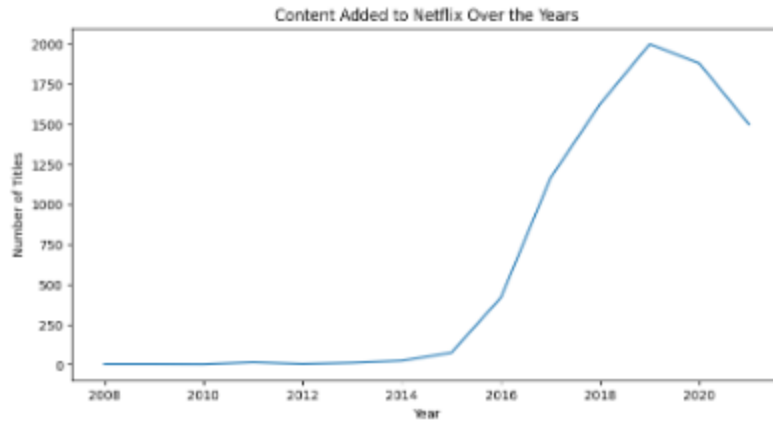

This graph shows the top 10 countries contributing content to Netflix. It highlights the countries with the highest number of movies and TV shows available on the platform.

3. Content Added to Netflix Over the Years

This visualization illustrates the growth of Netflix's content library over time. It shows the number of titles added each year and helps identify periods of rapid expansion.

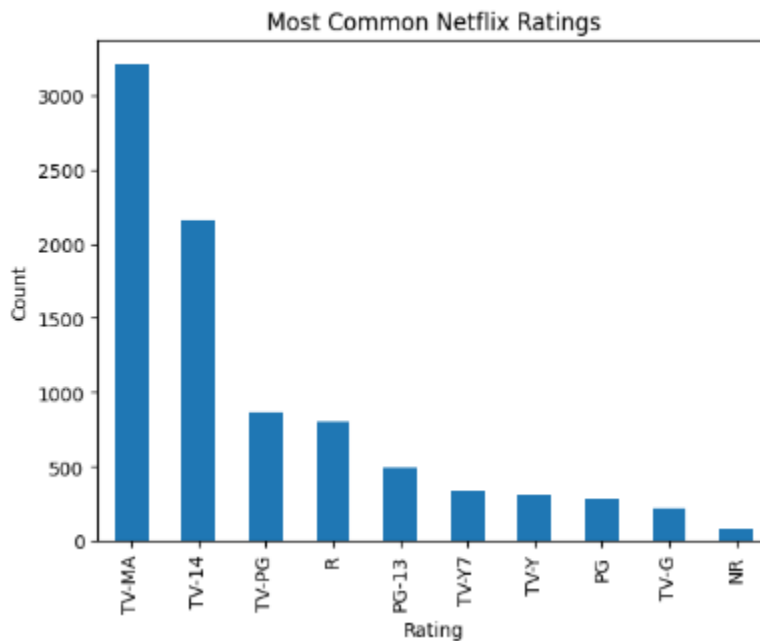

••

4. Most Common Netflix Ratings

This graph displays the most frequently used content ratings on Netflix. It provides insights into the target audience and content classification across the platform.

•••

Findings

1. The analysis showed that Movies are more common on Netflix than TV Shows, indicating that movies make up the majority of the platform's content library.
2. The United States contributes the highest number of titles, making it the leading content-producing country on Netflix.
3. The number of titles added to Netflix increased significantly after 2015, demonstrating the rapid growth and expansion of the platform.
4. TV-MA and TV-14 are among the most frequently used content ratings, suggesting that Netflix offers a large amount of content targeted toward mature and teenage audiences.
5. The visualizations revealed that Netflix has continuously expanded its collection over the years, providing a diverse range of entertainment content for viewers worldwide.

Conclusion

The Netflix Movies and TV Shows analysis provided valuable insights into the platform's content distribution and growth trends. The study revealed that movies constitute a larger portion of Netflix's library compared to TV shows, while the United States remains the largest contributor of content. The analysis also showed a significant increase in the number of titles added after 2015, highlighting Netflix's rapid expansion over recent years.

By using Python libraries such as Pandas, Matplotlib, and Seaborn, it was possible to explore, analyze, and visualize the dataset effectively. This project demonstrates how data analysis and visualization

techniques can be used to uncover meaningful patterns and support data-driven decision-making.
